

Scope Document

Project Name

Game Intelligence Leak Testing – GeoGuessr

Project Objective

The objective of this project is to perform manual and exploratory testing on the GeoGuessr web application to identify gameplay intelligence leaks, client-side data exposure, and issues that may impact fairness, integrity, and user experience.

Application Under Test (AUT)

GeoGuessr Web Application

Scope of Testing

In Scope

- Gameplay functionality validation
- Round loading and progression
- Map interaction and navigation
- Guess submission process
- Score display verification
- Browser Network Traffic Inspection
- Client-side data exposure analysis
- Gameplay intelligence leak identification
- Exploratory testing using Chrome DevTools

Out of Scope

- Source code review
- Server-side testing
- Database testing
- Performance and load testing
- Penetration testing
- Authentication and payment module testing

Testing Approach

The project follows a Manual Testing and Exploratory Testing approach. Browser Developer Tools were used to inspect client-side network responses and identify any exposure of answer-related information that could affect gameplay integrity.

Key Deliverables

- Test Plan
- Functional Test Cases
- Security Test Cases
- Defect Report
- Bug Log
- Test Execution Report
- Test Summary Report
- Evidence Screenshots
- Screen Recording

Expected Outcome

To identify and document any gameplay intelligence leaks or client-side information exposure that could provide players with an unfair advantage and impact the overall fairness of the game.
